The cDNA was directionally ligated into the Uni-Zap XR vector (Stratagene) and packaged using the Gigapack III Gold packaging extracts. Phagemids containing cDNA inserts were in vivo excised from the recombinant Uni-ZAP XR vector using Exassist helper phage and the E. coli strain XLI-Blue MRF (Stratagene). Excised plasmids were plated using SOLR cells."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note="Yestor: Lambda Zap; Seedlings were exposed either to 100 gy gamma or 0.5, 1, 5, or 10 kJ/m2 UV irradiation. Gamma-irradiated samples were harvested at 6, 12, 24 and 48 hours after treatment. UV-irradiated samples were harvested 24 hours post-treatment. cDNA was prepared polyA+ enriched, pooled samples of equivalent amounts of total RNA from each sample. The cDNA was directionally
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /tissue_type="seedlings"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  //dev_stage="third stage larvae, six days after infection"
//lab_host="E. coli XIJ-Blue"
//lab_host="E. coli XIJ-Blue"
//note="vector: lambda2apII (UniZap XR); Site_1: Eco R I
(5' end); Site_2: Xho I (3' end); Brugia malayi is a
lymphatic filarial nematode parasite of humans. mRNA was
prepared from third stage larvae of Brugia malayi isolated
from the peritoneal cavity of jirds six days after
infection. The mRNA was converted to double stranded cDNA
using reverse transcriptase and oligo(dT) followed by
RNAse H and DNApol I. The library had 2 x 10E5 independent
recombinants and average insert size was 900 base pairs.
The library was constructed by Michelle Lizotte-Waniewski.
The library is available from The Filarial Genome Project

```

pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

All and A2 domains segment comprises the c-terminal 85 amino acids of B domain and the A3, into the same plasmid seperated by 42 nucleotides coding for 14 residues control sequences, that directs the transcription and translation of the B domain, that is deleted. This plasmid is operably linked to factor VIII gene. The adeno-associated viral vectors are used for gene therapy, because of their broad host range, safety profile and duration of the range of the same philia. This method allows prolonged expression of the therapy, because of their broad host range, safety profile and duration

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present DNA sequence is a recombinant adenovirus-associated vector, (rAAV) construct, pAAV-F8-1. This expression vector comprises the HNF-3 albumin promoter, the first intron (-573 to +985) of human elongation factor-lalpha (EF1alpha) gene, human Factor VIII coding sequence (hFVIII) and polyadenylation signal from human growth hormone (hGH). This sequence is inserted between the AAV inverted terminal repeat (ITR) regions. The

The rAAV vector provides high level and long term expression of biologically active clotting factor VIII in vivo. The present sequence is pAAV-F8-1 vector without the plasmid backbone. It comprises HNF-3.mouse albumin promoter, a synthetic intron based on human elongation factor lalpha (EFlalpha) and immunoglobulin G (IGG) intron sequences, B-domain deleted human factor VIII coding sequence, poly A signal based on rabbit beta-globin sequence and AAV inverted terminal repeats (ITRS) at the ends. The vector encodes both the light and heavy chains of human factor VIII.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 11933 BP; 3258 A; 2818 C; 2717 G; 3140 T; 0 other;
